1 Survival Models

By overriding the force of mortality and global parameters, we can use makehams to implement a variety of survival models. For instance, it is possible to use a constant force of mortality, μ or a uniform pdf for $T(x)$.

1.1 Constant force of mortality

For CFM, use the `cfm` function

```
> library(makehams)
> cfm()
> tpx(5,20)

[1] 0.8187308

> Ax(20,c=1)

[1] 0.4505003

> annx(20,c=1)

[1] 11.26251

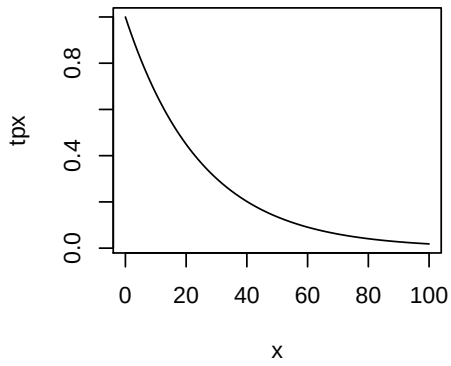
> Ax(x=21,c=1) - annx(x=21,c=1)*Ax(x=20,c=1)/annx(x=20,c=1)

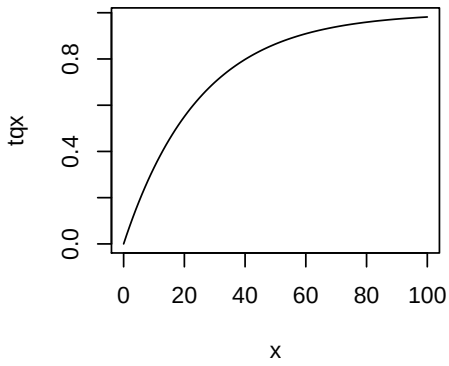
[1] 1.110223e-16

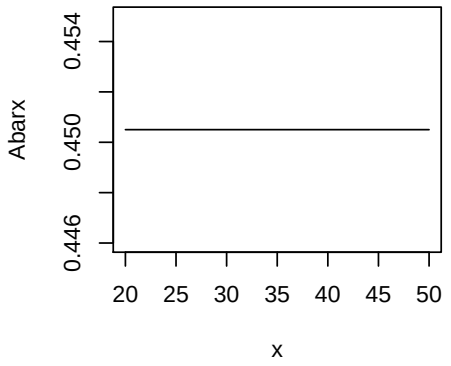
> thV(t=0,h=1,s=0.05)

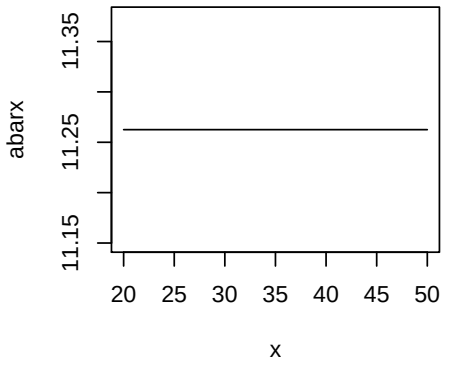
[1] 3.235954

> par(mfrow=c(2,2))
> plot(tpx, 0, 100)
> plot(tqx, 0, 100)
> plot(function(x)
+   sapply(x, function(s) Ax(s,c=1)), 20, 50, ylab="Abarx", xlab="x")
> plot(function(x)
+   sapply(x, function(s) annx(s,c=1)), 20, 50, ylab="abarx", xlab="x")
```









1.2 De Moivre's Law

For De Moivre's Law, we can use the `demoivres` function

```
> demoivres()
> tpx(5,20)

[1] 0.9375

> Ax(x=20,c=1)

[1] 0.2510299

> annx(x=20,c=1)

[1] 15.35084

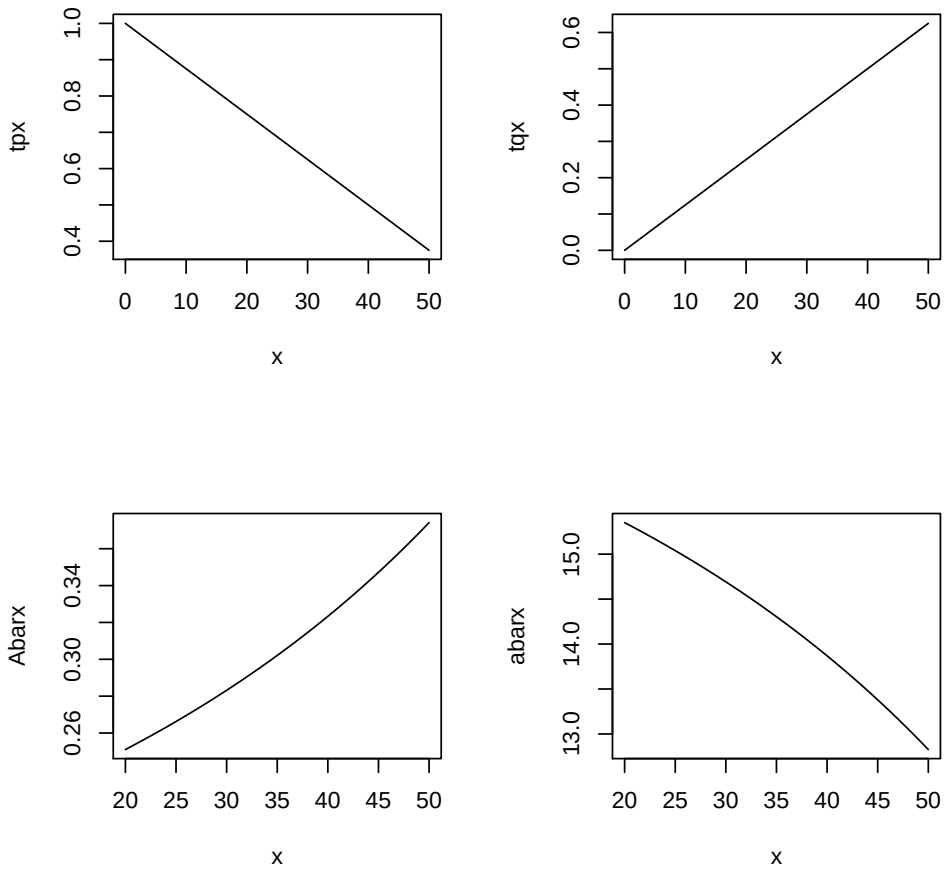
> Ax(x=21,c=1) - annx(x=21,c=1)*Ax(x=20,c=1)/annx(x=20,c=1)

[1] 0.003893153
```

```
> thV(t=0,h=1,s=0.05)

[1] 3.221968

> par(mfrow=c(2,2))
> plot(tpx, 0, 50)
> plot(tqx, 0, 50)
> plot(function(x)
+   sapply(x, function(s) Ax(s,c=1)), 20, 50, ylab="Abarx", xlab="x")
> plot(function(x)
+ sapply(x, function(s) annx(s,c=1)), 20, 50, ylab="abarx", xlab="x")
```



1.3 Makeham's Law

For Makeham's Law, we can use the `makehams` function

```
> makehams()
> tpx(5,20)
```

```
[1] 0.9987601

> Ax(x=20,c=1)

[1] 0.05043333

> annx(x=20,c=1)

[1] 19.46226

> Ax(x=21,c=1) - annx(x=21,c=1)*Ax(x=20,c=1)/annx(x=20,c=1)

[1] 0.002400081

> thV(t=0,h=1,s=0.05)

[1] 3.215593

> par(mfrow=c(2,2))
> plot(tpx, 0, 50)
> plot(tqx, 0, 50)
> plot(function(x)
+   sapply(x, function(s) Ax(s,c=1)), 20, 50, ylab="Abarx", xlab="x")
> plot(function(x)
+   sapply(x, function(s) annx(s,c=1)), 20, 50, ylab="abarx", xlab="x")
```
